Interval Analysis

Let $X = [x^L, x^U]$ and $Y = [y^L, y^U]$ 2 intervals.

Moore (1966) defines the **interval arithmetic** as follows:

$$\left\{ \begin{array}{l} [x^L, x^U] + [y^L, y^U] = [x^L + y^L, x^U + y^U] \\ [x^L, x^U] - [y^L, y^U] = [x^L - y^U, x^U - y^L] \\ [x^L, x^U] \times [y^L, y^U] = [\min\{x^L y^L, x^L y^U, x^U y^L, x^U y^U\}, \\ \quad \max\{x^L y^L, x^L y^U, x^U y^L, x^U y^U\}] \\ [x^L, x^U] \div [y^L, y^U] = [x^L, x^U] \times [\frac{1}{y^U}, \frac{1}{y^L}] \text{ if } 0 \notin [y^L, y^U]. \end{array} \right.$$

Remark

Subtraction and division are not the inverse operations of addition and respectively multiplication.

Difficulties:

$\div 0 \implies$ **extended interval arithmetic**, (E. Hansen).

Numerical errors \implies **rounded interval analysis**, (Moore).

Interval Analysis

Let $X = [x^L, x^U]$ and $Y = [y^L, y^U]$ 2 intervals.

Moore (1966) defines the **interval arithmetic** as follows:

$$\left\{ \begin{array}{l} [x^L, x^U] + [y^L, y^U] = [x^L + y^L, x^U + y^U] \\ [x^L, x^U] - [y^L, y^U] = [x^L - y^U, x^U - y^L] \\ [x^L, x^U] \times [y^L, y^U] = [\min\{x^L y^L, x^L y^U, x^U y^L, x^U y^U\}, \\ \quad \max\{x^L y^L, x^L y^U, x^U y^L, x^U y^U\}] \\ [x^L, x^U] \div [y^L, y^U] = [x^L, x^U] \times [\frac{1}{y^U}, \frac{1}{y^L}] \text{ if } 0 \notin [y^L, y^U]. \end{array} \right.$$

Remark

Subtraction and division are not the inverse operations of addition and respectively multiplication.

Difficulties:

$\div 0 \implies$ **extended interval arithmetic**, (E. Hansen).

Numerical errors \implies **rounded interval analysis**, (Moore).

Interval Analysis

Let $X = [x^L, x^U]$ and $Y = [y^L, y^U]$ 2 intervals.

Moore (1966) defines the **interval arithmetic** as follows:

$$\left\{ \begin{array}{l} [x^L, x^U] + [y^L, y^U] = [x^L + y^L, x^U + y^U] \\ [x^L, x^U] - [y^L, y^U] = [x^L - y^U, x^U - y^L] \\ [x^L, x^U] \times [y^L, y^U] = [\min\{x^L y^L, x^L y^U, x^U y^L, x^U y^U\}, \\ \quad \max\{x^L y^L, x^L y^U, x^U y^L, x^U y^U\}] \\ [x^L, x^U] \div [y^L, y^U] = [x^L, x^U] \times [\frac{1}{y^U}, \frac{1}{y^L}] \text{ if } 0 \notin [y^L, y^U]. \end{array} \right.$$

Remark

Subtraction and division are not the inverse operations of addition and respectively multiplication.

Difficulties:

$\div 0 \implies$ **extended interval arithmetic**, (E. Hansen).

Numerical errors \implies **rounded interval analysis**, (Moore).

Interval Analysis

Let $X = [x^L, x^U]$ and $Y = [y^L, y^U]$ 2 intervals.

Moore (1966) defines the **interval arithmetic** as follows:

$$\left\{ \begin{array}{l} [x^L, x^U] + [y^L, y^U] = [x^L + y^L, x^U + y^U] \\ [x^L, x^U] - [y^L, y^U] = [x^L - y^U, x^U - y^L] \\ [x^L, x^U] \times [y^L, y^U] = [\min\{x^L y^L, x^L y^U, x^U y^L, x^U y^U\}, \\ \quad \max\{x^L y^L, x^L y^U, x^U y^L, x^U y^U\}] \\ [x^L, x^U] \div [y^L, y^U] = [x^L, x^U] \times [\frac{1}{y^U}, \frac{1}{y^L}] \text{ if } 0 \notin [y^L, y^U]. \end{array} \right.$$

Remark

Subtraction and division are not the inverse operations of addition and respectively multiplication.

Difficulties:

$\div 0 \implies$ **extended interval arithmetic**, (E. Hansen).

Numerical errors \implies **rounded interval analysis**, (Moore).

Property

For all $x \in X$ and $y \in Y$, one has: $x \star y \in X \star Y$, where \star is $+$, $-$, \times , \div .

Property

*Let A, B, C 3 intervals, therefore
 $A \times (B + C) \subseteq A \times B + A \times C$.*

Property

*Let Y_1, Y_2, Z_1, Z_2 4 intervals, if $Y_1 \subseteq Z_1$ and if $Y_2 \subseteq Z_2$ then
 $Y_1 \star Y_2 \subseteq Z_1 \star Z_2$ where \star is $+$, $-$, \times , \div .*

Definition

An **inclusion function** $F(X)$ of f over a box X is such that

$$f(X) := \left[\min_{x \in X} f(x), \max_{x \in X} f(x) \right] \subseteq F(X) = [F^L(X), F^U(X)]$$

Theorem

The *natural extension* into interval of an expression of f over a box X is an inclusion function.

Example

Let $f(x) = x^2 - x + 1$ and $x \in X = [0, 1]$

Inclusion functions:

- ▶ $F_1(X) = X^2 - X + 1 = [0, 1]^2 - [0, 1] + [1, 1] = [0, 2]$,
- ▶ $F_2(X) = X(X - 1) + 1 = [0, 1]([0, 1] - 1) + [1, 1] = [0, 1] \times [-1, 0] + [1, 1] = [0, 1]$,
- ▶ $F_3(X) = \left(X - \frac{1}{2}\right)^2 + \frac{3}{4} = \left[-\frac{1}{2}, \frac{1}{2}\right]^2 + \frac{3}{4} = \left[\frac{3}{4}, 1\right]$,

Natural Extension: an Inclusion Function

Theorem

$$\left\{ \begin{array}{l} [a, b] + [c, d] = [\underline{a + c}, \overline{b + d}] \\ [a, b] - [c, d] = [\underline{a - d}, \overline{b - c}] \\ [a, b] \times [c, d] = [\min\{\underline{ac}, \underline{ad}, \underline{bc}, \underline{bd}\}, \\ \max\{\overline{ac}, \overline{ad}, \overline{bc}, \overline{bd}\}] \\ [a, b] \div [c, d] = [a, b] \times [\frac{1}{d}, \frac{1}{c}] \text{ if } 0 \notin [c, d]. \end{array} \right.$$

Where \underline{a} , resp. \overline{a} , represents the **nearest under**, resp. **over**, floating point representation of the real x

Extended Interval Analysis

Let $X = [a, b]$ and $Y = [c, d]$ 2 intervals.

E. Hansen defines the **extended interval arithmetic** for the division X/Y with $0 \in Y$, as follows:

$$X/Y = \begin{cases} [b/c, +\infty], & \text{if } b \leq 0 \text{ and } d = 0, \\ [-\infty, b/d] \cup [b/c, +\infty], & \text{if } b \leq 0 \text{ and } c < 0 < d, \\ [-\infty, b/d], & \text{if } b \leq 0 \text{ and } c = 0, \\ [-\infty, +\infty], & \text{if } a < 0 < b, \\ [-\infty, a/c], & \text{if } a \geq 0 \text{ and } d = 0, \\ [-\infty, a/c] \cup [a/d, +\infty], & \text{if } a \geq 0 \text{ and } c < 0 < d, \\ [a, b] \pm [-\infty, +\infty] = [-\infty, +\infty] \\ [a/d, +\infty], & \text{if } a \geq 0 \text{ and } c = 0, \end{cases}$$

For the addition and the subtraction:

$$\begin{cases} [a, b] + [-\infty, d] = [-\infty, b + d] \\ [a, b] + [c, +\infty] = [a + c, +\infty] \\ [a, b] \pm [-\infty, +\infty] = [-\infty, +\infty] \\ [a, b] - [-\infty, d] = [a - d, +\infty] \\ [a, b] - [c, +\infty] = [-\infty, b - c] \end{cases}$$

Extended Interval Analysis

Let $X = [a, b]$ and $Y = [c, d]$ 2 intervals.

E. Hansen defines the **extended interval arithmetic** for the division X/Y with $0 \in Y$, as follows:

$$X/Y = \begin{cases} [b/c, +\infty], & \text{if } b \leq 0 \text{ and } d = 0, \\ [-\infty, b/d] \cup [b/c, +\infty], & \text{if } b \leq 0 \text{ and } c < 0 < d, \\ [-\infty, b/d], & \text{if } b \leq 0 \text{ and } c = 0, \\ [-\infty, +\infty], & \text{if } a < 0 < b, \\ [-\infty, a/c], & \text{if } a \geq 0 \text{ and } d = 0, \\ [-\infty, a/c] \cup [a/d, +\infty], & \text{if } a \geq 0 \text{ and } c < 0 < d, \\ [a, b] \pm [-\infty, +\infty] = [-\infty, +\infty] \\ [a/d, +\infty], & \text{if } a \geq 0 \text{ and } c = 0, \end{cases}$$

For the addition and the subtraction:

$$\begin{cases} [a, b] + [-\infty, d] = [-\infty, b + d] \\ [a, b] + [c, +\infty] = [a + c, +\infty] \\ [a, b] \pm [-\infty, +\infty] = [-\infty, +\infty] \\ [a, b] - [-\infty, d] = [a - d, +\infty] \\ [a, b] - [c, +\infty] = [-\infty, b - c] \end{cases}$$

Inclusion Functions based on Taylor's Expansions: Univariate Case

Let f be a **univariate** differentiable function, and x, y and ξ , 3 variables of X an interval of \mathbb{R} .

$$f(x) = f(y) + (x-y)f'(y) + \frac{(x-y)^2}{2}f''(y) + \dots + \frac{(x-y)^n}{n!}f^{(n)}(\xi)$$

Let denote $F^{(n)}(X)$ an enclosure of $f^{(n)}(\xi)$ over X (computed with an interval automatic differentiation tool).

Hence,

$$f(x) \in f(y) + (x-y)f'(y) + \frac{(x-y)^2}{2}f''(y) + \dots + \frac{(x-y)^n}{n!}F^{(n)}(X)$$

2 inclusion functions:

$$\triangleright T_1(y, X) = f(y) + (X - y)F'(X)$$

$$\triangleright T_2(y, X) = f(y) + (X - y)f'(y) + \frac{(X - y)^2}{2}F''(X)$$

Inclusion Functions based on Taylor's Expansions: Univariate Case

Let f be a **univariate** differentiable function, and x , y and ξ , 3 variables of X an interval of \mathbb{R} .

$$f(x) = f(y) + (x-y)f'(y) + \frac{(x-y)^2}{2}f''(y) + \dots + \frac{(x-y)^n}{n!}f^{(n)}(\xi)$$

Let denote $F^{(n)}(X)$ an enclosure of $f^{(n)}(\xi)$ over X (computed with an interval automatic differentiation tool).

Hence,

$$f(x) \in f(y) + (x-y)f'(y) + \frac{(x-y)^2}{2}f''(y) + \dots + \frac{(x-y)^n}{n!}F^{(n)}(X)$$

2 inclusion functions:

$$\triangleright T_1(y, X) = f(y) + (X - y)F'(X)$$

$$\triangleright T_2(y, X) = f(y) + (X - y)f'(y) + \frac{(X - y)^2}{2}F''(X)$$

Inclusion Functions based on Taylor's Expansions: Univariate Case

Let f be a **univariate** differentiable function, and x , y and ξ , 3 variables of X an interval of \mathbb{R} .

$$f(x) = f(y) + (x-y)f'(y) + \frac{(x-y)^2}{2}f''(y) + \dots + \frac{(x-y)^n}{n!}f^{(n)}(\xi)$$

Let denote $F^{(n)}(X)$ an enclosure of $f^{(n)}(\xi)$ over X (computed with an interval automatic differentiation tool).

Hence,

$$f(x) \in f(y) + (x-y)f'(y) + \frac{(x-y)^2}{2}f''(y) + \dots + \frac{(x-y)^n}{n!}F^{(n)}(X)$$

2 inclusion functions:

▶ $T_1(y, X) = f(y) + (X - y)F'(X)$

▶ $T_2(y, X) = f(y) + (X - y)f'(y) + \frac{(X - y)^2}{2}F''(X)$

Baumann Centered Forms: Univariate Case

Optimal Baumann center \underline{c}_B for the **best lower bound** for T_1 :

$$\underline{z}_B := T_1^L(\underline{c}_B, X) = \max_{y \in X} T_1^L(y, X) = (f(y) + (X - y)F'(X))^L$$

Optimal Baumann center \bar{c}_B for the **best upper bound** for T_1 :

$$\bar{z}_B := T_1^U(\bar{c}_B, X) = \min_{y \in X} T_1^U(y, X) = (f(y) + (X - y)F'(X))^U$$

Baumann in 1988 gives **analytical solution** for \underline{c}_B (and \bar{c}_B).

$$\underline{c}_B := \frac{x^L(F')^U(X) - x^U(F')^L(X)}{(F')^U(X) - (F')^L(X)}$$

if $0 \notin F'(X)$, else monotony case.

Easy to generalize to **multivariate differentiable functions**.

Design of
Machines

Realizations &
Conclusion

Start with $f(x) \in f(y) + (x - y)F'(X), \forall (x, y) \in X^2$

Case when $0 \in F'(X)$ (else it is obvious):

2 affine underestimations:

$$\triangleright f(x) \geq f(x^L) + (x - x^L)(F')^L(X), \forall x \in X,$$

$$\triangleright f(x) \geq f(x^U) + (x - x^U)(F')^U(X), \forall x \in X,$$

Therefore, the intersection is a **minorant** of f over X :

$$z_{lbvf} = \frac{(F')^U(X)f(x^L) - (F')^L(X)f(x^U)}{(F')^U(X) - (F')^L(X)} + \frac{(x^U - x^L)(F')^L(X)(F')^U(X)}{(F')^U(X) - (F')^L(X)}$$

Same think for constructing a majorant.

Problem for a generalization to the multivariate differentiable case.

Comparison between Baumann and Linear Boundary Value Forms: Univariate Case

Notations: $X = [a, b]$ and $F'(X) = [L, U]$, with $L < 0 < U$.

Baumann Form:

$$\underline{c}_B = \frac{aU - bL}{U - L} \text{ and } \underline{z}_B = f(\underline{c}_B) + \frac{(b - a)LU}{U - L}$$

Linear Boundary Value Form:

$$z_{lbvf} = \frac{U}{U - L} f(a) + \frac{-L}{U - L} f(b) + \frac{(b - a)LU}{U - L}$$

Comparison between:

$$f(\underline{c}_B) \lessgtr? \frac{U}{U - L} f(a) + \frac{-L}{U - L} f(b)$$

- > **BF** produces the best lower bound,
- < **LBVF** produces the best lower bound,
- = equality occurs.

Let f be a **multivariate** differentiable function, and x and y , 2 variables of X an interval of \mathbb{R}^n .

2 inclusion functions:

$$\begin{aligned}\blacktriangleright T_1(y, X) &= f(y) + (X - y) \cdot G(X) \\ &= f(y) + \sum_{i=1}^n (X_i - y_i) \cdot G_i(X)\end{aligned}$$

$$\blacktriangleright T_2(y, X) = f(y) + (X - y) f'(y) + \frac{1}{2} (X - y)^T \cdot H(X) \cdot (X - y)$$

$G(X)$ represents the enclosure of the gradient and $H(X)$ the enclosure of the Hessian matrix over X .

Notations:

- ▶ $X = (X_1, \dots, X_n)$, where $X_i \subseteq \mathbb{R}$,
- ▶ $X_i = [a_i, b_i]$,
- ▶ $\frac{\partial f}{\partial x_i}(x) \in [L_i, U_i]$,
- ▶ f is define from X to \mathbb{R} .

Assumptions:

- ▶ $L_i < 0 < U_i$ (else monotonicity case),
- ▶ f is one time differentiable over X .

Baumann Centered Form in the Multivariate Case

Easy to generalize to **all the variables are separated**:

Optimal Baumann center \underline{c}_B for the **best lower bound** for T_1 :

$$\underline{z}_B := T_1^L(\underline{c}_B, X) = \max_{y \in X} T_1^L(y, X) = (f(y) + (X - y) \cdot G(X))^L$$

Baumann (1988) gives **analytical solution** for \underline{c}_B (and \overline{c}_B).

$$(\underline{c}_B)_i := \frac{a_i U_i - b_i L_i}{U_i - L_i}, \forall i \in \{1, \dots, n\}.$$

Hence,

$$\underline{z}_B = f(\underline{c}_B) + \sum_{i=1}^n \frac{(b_i - a_i) L_i U_i}{U_i - L_i}$$

Affine and Quadratic Forms

Difficulty of interval analysis: occurrences of the same variables.

For example: $x - x$, with $x \in [0, 1]$ yields to $[0, 1] - [0, 1] = [-1, 1]$.

Idea: Keep affine information during the computations.

$$GQF(X) \subseteq QF(X) \subseteq AF_2(X) \subseteq AF_1(X) = AF(X)$$

Example

Let $f(x, y) = x^2y - xy^2$ and $(x, y) \in X^2 = [-1, 3]^2$

Inclusion functions:

- ▶ $AF(X) = AF_1(X) = [-44, 44]$,
- ▶ $AF_2(X) = QF(X) = [-40, 40]$,
- ▶ $GQF(X) = [-24, 24]$,
- ▶ $NE(X) = [-36, 36]$.

Affine and Quadratic Forms

Difficulty of interval analysis: occurrences of the same variables.

For example: $x - x$, with $x \in [0, 1]$ yields to $[0, 1] - [0, 1] = [-1, 1]$.

Idea: Keep affine information during the computations.

$$GQF(X) \subseteq QF(X) \subseteq AF_2(X) \subseteq AF_1(X) = AF(X)$$

Example

Let $f(x, y) = x^2y - xy^2$ and $(x, y) \in X^2 = [-1, 3]^2$

Inclusion functions:

- ▶ $AF(X) = AF_1(X) = [-44, 44]$,
- ▶ $AF_2(X) = QF(X) = [-40, 40]$,
- ▶ $GQF(X) = [-24, 24]$,
- ▶ $NE(X) = [-36, 36]$.

Affine and Quadratic Forms

Difficulty of interval analysis: occurrences of the same variables.

For example: $x - x$, with $x \in [0, 1]$ yields to $[0, 1] - [0, 1] = [-1, 1]$.

Idea: Keep affine information during the computations.

$$GQF(X) \subseteq QF(X) \subseteq AF_2(X) \subseteq AF_1(X) = AF(X)$$

Example

Let $f(x, y) = x^2y - xy^2$ and $(x, y) \in X^2 = [-1, 3]^2$

- ▶ $AF_2(X) = QF(X) = [-40, 40]$,
- ▶ $GQF(X) = [-24, 24]$,
- ▶ $NE(X) = [-36, 36]$.

Affine and Quadratic Forms

Difficulty of interval analysis: occurrences of the same variables.

For example: $x - x$, with $x \in [0, 1]$ yields to $[0, 1] - [0, 1] = [-1, 1]$.

Idea: Keep affine information during the computations.

$$GQF(X) \subseteq QF(X) \subseteq AF_2(X) \subseteq AF_1(X) = AF(X)$$

Example

Let $f(x, y) = x^2y - xy^2$ and $(x, y) \in X^2 = [-1, 3]^2$

Inclusion functions:

- ▶ $AF(X) = AF_1(X) = [-44, 44]$,
- ▶ $AF_2(X) = QF(X) = [-40, 40]$,
- ▶ $GQF(X) = [-24, 24]$,
- ▶ $NE(X) = [-36, 36]$.

Affine and Quadratic Forms

Difficulty of interval analysis: occurrences of the same variables.

For example: $x - x$, with $x \in [0, 1]$ yields to $[0, 1] - [0, 1] = [-1, 1]$.

Idea: Keep affine information during the computations.

$$GQF(X) \subseteq QF(X) \subseteq AF_2(X) \subseteq AF_1(X) = AF(X)$$

Example

Let $f(x, y) = x^2y - xy^2$ and $(x, y) \in X^2 = [-1, 3]^2$

Inclusion functions:

- ▶ $AF(X) = AF_1(X) = [-44, 44]$,
- ▶ $AF_2(X) = QF(X) = [-40, 40]$,
- ▶ $GQF(X) = [-24, 24]$,
- ▶ $NE(X) = [-36, 36]$.

Realizations &
Conclusion

- ▶ **Choice** a box in a list:
 - ▶ Largest box,
 - ▶ Oldest box,
 - ▶ The box which has the lowest lower bound.
 - ▶ Other Heuristics, see Csendes et al.
- ▶ **Bisection** of a box:
 - ▶ in two equal parts following the largest edge,
 - ▶ in two parts following the Baumann center,
 - ▶ in two equal parts following the largest $D_i = w(G_i(X))w(X_i)$
 - ▶ Multisection methods, see Csendes et al., and Lagouanelle-Soubry (JOGO 2004) for theoretical results on optimal multisection techniques.
- ▶ **Stopping criteria**:
 - ▶ the smallest lower bound of all the boxes in the list is sufficiently closed to \bar{f} ,
 - ▶ the largest box in the list is less than a given ϵ ,
 - ▶ Combination of both.

Numerical Examples: Baumann Form vs Admissible Simplex Form

Standard-PC computer with an 1.8GHz AMD Athlon Processor and 256Mb RAM using a Fortran-90 compiler.

All the computations, even the floating-point operations, are performed using **rounded interval analysis**.

14 differentiable functions from the literature, as for examples:

- $f_1(x) = 1 + (x_1^2 + 2)x_2 + x_1x_2^2, x_1 \in [1, 2], x_2 \in [-10, 10]$
 $\epsilon = 10^{-8}, f^* = -3.5, x^* = (2, -1.5).$
- $f_2(x) = 2x_1^2 - 1.05x_1^4 + x_2^2 - x_1x_2 + \frac{1}{6}x_2^6, \forall x_i \in [-2, 4]$
 $\epsilon = 10^{-8}, f^* = -239.696, x^* = (4, 1.115).$
 $-f_2(x) = -2x_1^2 - 1.05x_1^4 + x_2^2 - x_1x_2 + \frac{1}{6}x_2^6, \forall x_i \in [-2, 4]$
 $\epsilon = 10^{-8}, f^* = -239.696, x^* = (4, 1.115).$
- $f_3(x) = (x_1 - 2x_2 - 7)^2 + (2x_1 + x_2 - 5)^2, x_1 \in [-2.5, 3.5], x_2 \in [-1.5, 4.5]$
 $\epsilon = 10^{-8}, f^* = 0.45, x^* = (3.4, -1.5).$

Where, f^* represents the optimal value and x^* a corresponding optimizer.

Interval Branch and Bound Algorithm: Interval Newton Step

Notations: $X \subseteq \mathbb{R}^n$, we consider f over X , $G(X)$ is an enclosure of the **gradient** of f over X and $H(X)$ is an enclosure of the **Hessian matrix** of f over X .

One Interval Newton Step:

1. Choose $x \in X$,
2. Solve $H(X)(x - Y) = \nabla f(x)$, denote Z the resulting enclosure of the solution Y
3. $X' := X \cap Z$.

Property

- ▶ If ξ is a zero of ∇f then $\xi \in X'$.
- ▶ If $X' = \emptyset$ then ∇f does not have a zero in X .
- ▶ If $Z \subseteq X$ then a zero exists in X .

Interval Branch and Bound Algorithm: Interval Newton Step

Notations: $X \subseteq \mathbb{R}^n$, we consider f over X , $G(X)$ is an enclosure of the **gradient** of f over X and $H(X)$ is an enclosure of the **Hessian matrix** of f over X .

Principle of a Branch and Bound Algorithm for a problem with constraints

Notation:

$$\begin{cases} \min_{x \in \mathbb{R}^n} f(x) \\ g_i(x) \leq 0 \quad \forall i \in \{1, \dots, n_g\} \\ h_j(x) = 0 \quad \forall j \in \{1, \dots, n_h\} \end{cases}$$

- ▶ **Choice and Subdivision of the box X** , (in 2 parts by step): list of possible solutions,
- ▶ **Reduction of the sub-boxes**, by using a constraint propagation technique,
- ▶ **Computation of bounds** of the functions F , G_j , H_j on the sub-boxes, - inclusion functions -
- ▶ Elimination of the sub-boxes which cannot contain the global optimum: $F^L(X) > \tilde{f}$ or $G_i^L(X) > 0$ or $0 \notin H(X)$, where \tilde{f} denotes the current solution,
- ▶ **STOP** when accurate enclosures of the optimum are obtained.

Propagation Techniques

$c(x) \in [a, b]$ is a constraint \implies implicit (or explicit) relations between the variables of the problem.

Idea: use some deduction steps for reducing the box X .

Linear case: if $c(x) = \sum_{i=1}^n a_i x_i$ then:

$$X_k := \left(\frac{[a, b] - \sum_{i=1, i \neq k}^n a_i X_i}{a_k} \right) \cap X_k, \text{ si } a_k \neq 0. \quad (1)$$

where k is in $\{1, \dots, n\}$ and X_i is the i^{th} component of X .

Non-linear case: Idea (E. Hansen): one linearizes using T_1 (or T_2). Then one solve a linear system with interval coefficients.

Other Idea: construction of the calculus tree and propagation.

Propagation Techniques

$c(x) \in [a, b]$ is a constraint \implies implicit (or explicit) relations between the variables of the problem.

Continuous variables: real variables (dimensions of an electrical machines such as the diameter).

Discrete variables: integer (number of pair of poles of a machine), boolean (machine with or without slot), categorical variable (which kind of magnet is used).

For integer and boolean variables \implies **relaxation** for computing bounds + particular bisection technique and propagation.

For categorical variables \implies we introduce 4 particular algorithms with propagation and retro-propagation + properties about the bisection techniques.

- Dimensioning Inverse Problem:

$$\begin{cases} \min_{x \in \mathbb{R}^n} f(x) \\ g_i(x) \leq 0 \quad \forall i \in \{1, \dots, n_g\} \\ h_j(x) = 0 \quad \forall j \in \{1, \dots, n_h\} \end{cases}$$

- More General Inverse Problem of Design:

$$\begin{cases} \min_{\substack{x \in \mathbb{R}^{n_r}, z \in \mathbb{N}^{n_e}, \\ \sigma \in \prod_{i=1}^{n_c} K_i, b \in B^{n_b}}} f(x, z, \sigma, b) \\ g_i(x, z, \sigma, b) \leq 0 \quad \forall i \in \{1, \dots, n_g\} \\ h_j(x, z, \sigma, b) = 0 \quad \forall j \in \{1, \dots, n_h\} \end{cases}$$

- ▶ Dimensioning Inverse Problem:

$$\begin{cases} \min_{x \in \mathbb{R}^n} f(x) \\ g_i(x) \leq 0 \quad \forall i \in \{1, \dots, n_g\} \\ h_j(x) = 0 \quad \forall j \in \{1, \dots, n_h\} \end{cases}$$

- ▶ More General Inverse Problem of Design:

$$\begin{cases} \min_{\substack{x \in \mathbb{R}^{n_r}, z \in \mathbb{N}^{n_e}, \\ \sigma \in \prod_{i=1}^{n_c} K_i, b \in B^{n_b}}} f(x, z, \sigma, b) \\ g_i(x, z, \sigma, b) \leq 0 \quad \forall i \in \{1, \dots, n_g\} \\ h_j(x, z, \sigma, b) = 0 \quad \forall j \in \{1, \dots, n_h\} \end{cases}$$

Rotating Machines with Magnetic Effects

- Criteria :**

$$\begin{cases} V_{ap} = \pi \frac{D}{\lambda} (D + E - e - l_a) (2C + E + e + l_a) \\ V_m = \pi \beta l_a \frac{D}{\lambda} (D - 2e - l_a) \\ P_j = \pi \rho_{cu} \frac{D}{\lambda} (D + E) E_{ch} \end{cases}$$

Constraints :

$$C_{em} = \frac{\pi}{2\lambda} (1 - K_f) \sqrt{k_r \beta E_{ch} E} D^2 (D + E) B_e$$

$$E_{ch} = AJ_{cu} = k_r EJ_{cu}^2, K_f \approx 1.5 p \beta \frac{e + E}{D}, B_e = \frac{2l_a P}{D \log \left(\frac{D + 2E}{D - 2(l_a + e)} \right)}$$

$$C = \frac{\pi \beta B_e}{4 p B_{fer}} D, p = \frac{\pi D}{\Delta_p}, e_{\min} - e \leq 0, K_f - K_{f \max} \leq 0$$

Example for the Dimensioning of an Electrical Motor

Electrical Slotless Rotating Machines with Permanent Magnet:

- ▶ IBBA standard (defined by Ratschek and Rokne 1988)
→ 1h35,
- ▶ IBBA + propagation due to E. Hansen → 41.5s,
- ▶ IBBA + propagation with the calculus tree → 0.5s.

Min Volume of Magnets

- internal rotor
- rectangular wav.
- with slot
- mag. powders
- $p = 2$
- magnet NdFeB

Min Volume of active parts

- internal rotor
- sinusoidal wav.
- slotless
- sheet metal
- $p = 6$
- magnet NdFeB

Min Weight

- internal rotor
- sinusoidal wav.
- slotless
- mag. powders
- $p = 6$
- special-magnet

Min Global Volume

- internal rotor
- rectangular wav.
- with slot
- sheet metal
- $p = 5$
- magnet NdFeB
